No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                        64

Sequence 19, Application US/09816277

Publication No. US20010034045A1

GENERAL INPORMATION:

APPLICANT: Ward, Michael

APPLICANT: Ward, Huming

APPLICANT: Valkonen, Marki

TITLE OF INVENTION: Increased Production of Secreted

TITLE OF INVENTION: Proteins by Recombinant Eukaryotic Cells

FILE REFERENCE: GC590-2

CURRENT APPLICATION NUMBER: US/09/816,277

CURRENT FILING DATE: 2001-03-23

PRIOR APPLICATION NUMBER: US 09/534,692
APPLICANT: Filgrim, Marsha L.
APPLICANT: Creelman, Robert A.
APPLICANT: Creelman, Robert A.
APPLICANT: Busell, Arnold N.
APPLICANT: Ratcliffe, Oliver
APPLICANT: Ratcliffe, Oliver
APPLICANT: Sherman, Bradley K.
TITLE OF INVENTION: Polymucleotides and Polypeptides in Plants
FILE REFERENCE: MBI-0048CIP
CURRENT APPLICATION NUMBER: US/10/412,699B

COX JS., Walter P.,
COX JS., Walter P.,
An ovel mechanism for regulating activity of a transcription factor
that controls the unfolded protein response.";
Cell 87:391-404(1996).
I-FUNCTION: Seems to be involved in the unfolded protein response
(UPR) pathway. Binds to the UPR element (UPRE) in the promoter of
UPR-regulated genes such as KAR2, PDI1, EUG1 and FKB2; activates
the transcription of these genes.
I-SUBUNIT: Homodimer.
SUBUNIT: Homodimer.
I-SUBCELLUTAR LOCATION: Nuclear (Probable).

Saloheimo MLA;

Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein

Example 3; Fig 10; 56pp; English.

The present invention relates to methods for increasing the secretion of heterologous protein in eukaryotic cells by inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HAC1, HACA, PTC2 or IRE1 in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipsae, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is yeast HAC1 protein DNA binding domain

```
heterologous nucleic acid encoding a protein having unfolded protein response modulating activity and a heterologous nucleic acid encoding a protein having unfolded protein protein of interest to be secreted. The methods and compositions of genetically manipulating cells to have an elevated unfolded protein response (URR) resulting in an increased capacity to produce secreted proteins, are useful in e.g. production of therapeutic or industrial enzymes. This is the amino acid sequence of Saccharomyces cerevisiae hacl chaperone and foldase DNA binding domain.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Tab) in the specification). ABN15762 to ABN27525 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide squences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperprolliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, disorders, haemorrhage, carefectaritisis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders related to organ transplantation, cardiovascular diseases, disorders, infectious diseases, autoimmune disorders such as multiple sclerosis, rheumatoid arbitis, autoimmune thyroiditis, myssthania gravis, graft-versus-host disease and autoimmune thyroiditis, myssthania gravis, graft-versus-host disease and autoimmune thyroiditis, myssthania gravis, graft-versus-host disease and autoimmune thyroiditis, ulcers, for treating organ cuseful for treating burns, infesions, ulcers, for treating organ cuseful for treating burns, infisions, ulcers, for treating organ cuseful con regeneration and treatment of lung or liver fibrosis, reportions and unity in various tissues and conditions resulting from reportions damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention trainers to a recombinant by computating a provide for expression of a polynucleotide encoding a polypeptide from a microbilation size relates to a transformed plant coll provide for expression of a polynucleotide encoding a polypeptide from a microbilation size relates to a transformed plant computating the recombinant DNA construct and a method of producing a transformed plant having an improved property Comprises transformed plant with the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct is useful for improving plant with the colluctuate or polypeptide is useful for improving plant with the improved plant properties, e.g. improved cold, heat or drought tolerance, concreased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or properties or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form at each at each at each or the form of the printed specification but was obtained in electronic form. New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties. invention relates to a recombinant DNA construct comprising Format from USPTO at segdata.uspto.gov/sequence.html Claim 1; SEQ ID NO 21867; 122pp; English

                                                                                         This sequence is the yeast transcriptional control protein, designated ERN4, of the invention. An alternatively spliced version of the protein is shown in AAW52806. Yeast cells transformed with a vector containing the DNA can be used for the recombinant production of a protein of interest at a high yield. The DNA controls a chaperone protein which turn is responsible for the correct folding of an enzyme involved in transcription, hence the cells can be used to control the transcription of a recombinant protein of interest
                                                                                                                                                                                                                                                                                                        Gaps
              DNA encoding a yeast transcriptional control protein - useful in the recombinant production of high yield of protein of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Chardonnens A, Shirley A, Wang X, Sarria-Millan R;

```

The invention relates an isolated nucleic acid molecule comprises a nucleic acid molecule encoding a Stress-Related Protein (SRP), from Yeast

```
cc b. coli and their homologues from Rice, Soybean and Rape. Also included are a transformed plant cell with altered metabolic activity is altered by transformed wild type plant cell (where the metabolic activity is altered by transformed wild type plant cell (where the metabolic activity is altered by transformed wild type plant cell) a transgenic plant and or corresponding non-transformed wild type plant cell), a transgenic plant generated from the plant cell above (and which is a monocot or dicot plant, or a gymnosperm plant), a seed produced by a transgenic plant above (where the seed is genetically concerpt in an increased tolerance to environmental stress as compared to a corresponding non-transformed wild type plant), a nucleic actid in a host cell translate and the nucleic actid molecule above (comprising one or more regulatory elements, where expression of the SRP (comprising one or more regulatory elements, where expression of the SRP (comprising nucleic acid in a host cell results in altered metabolic activity resulting in increased tolerance to environmental stress as compared to corresponding non-transformed wild type host cell), a vector comprising the nucleic acid molecule above or the nucleic acid construct, a host cell which has been transformed stably or transiently with the vector (or the nucleic acid molecules above, or the nucleic acid construct), an esquences fully given in the specification acid construct), an esquences fully given in the specification acid construct), an esquences fully given in the specification acid construct), an esquences fully given in the specification acid construct), and sequences fully given in the specification acid construct).

Compared to a corresponding non-transformed wild type plant cells or plants enverse increased tolerance of a plant, detecting environmental stress in corresponding non-transformed will type plant cells or plants enverse increased tolerance of a plant to a least one abiotic acid metabolic activity and/or a series to a plant transformed w
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            stress in plants or plant cells. The nucleic acids are useful for producing transformed plants with altered metabolic activity resulting in increased tolerance and/or resistance to an environmental stress (drought, heat, cold and sall) as compared to a corresponding nontransformed wild-type plant cell. The present sequence is a yeast SRP of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     82

The present sequence is that of the HACI protein of Trichoderma reesei, as deduced from the newly isolated HACI gene (see AARIS631). HACI protein is a transcription factor involved in the unfolded protein response (UPR). The invention provides methods for increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be actived by modulating the activity of HACI, PTC2 or IRBI in the cell, e.g. by gene overaxpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammalian cells, insect cells, yeast and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme, e.g. lipase, cellulase, endoglucanase-H, protease, carbohydratase, reductase, oxidase, isomerase, transferase, kinnse, phosphatease, alpha-amylase, olignocellulose hemicallulase, pectinase and ligninase (claimed). (Updated on 11-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Increasing secretion of heterologous proteins e.g. lipase and cellulase in eukaryotic cells useful in industry to increase production and facilitate purification, by inducing an elevated unfolded protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Heterologous protein secretion; unfolded protein response; UPR; lipase; cellulase; carbohydrase; industry; purification; HAC1 protein.

                                                                                                                                                                                                                                                                                                                                                                               interest at a high yield. The DNA controls a chaperone protein which in turn is responsible for the correct folding of an enzyme involved in transcription, hence the cells can be used to control the transcription of a recombinant protein of interest
                                                                                                                                                                                                                                                                                                    This sequence is the yeast transcriptional control protein, designated ERN4, of the invention. An alternatively spliced version of the protein is shown in AAW52805. Yeast cells transformed with a vector containing the DNA can be used for the recombinant production of a protein of
                                                                                                                                                                                                 DNA encoding a yeast transcriptional control protein - useful in the recombinant production of high yield of protein of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Trichoderma reesei HAC1, involved in unfolded protein response.

```

Claim 39; Fig 7; 56pp; English

The present invention relates to methods for increasing the secretion of protein rangement (UPR). The method involves inducing an elevated unfolded protein response (UPR). The method involves inducing the elevated UPR by increasing the presence of proteins such as HACI, HACI, PTC2 or IREI in cells. The method and sequences are useful for increasing the secretion of heterologous proteins (e.g. lipase, cellulase, carbohydrase) in eukaryotic cells useful in industry to increase protein yields and to facilitate purification. The present sequence is Trichoderma reesei HACI protein. (Updated on 29-AUG-2003 to standardise OS field)

Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR). Example 3; SEQ ID NO 2; 83pp; English

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an elevated unfolded protein response (UPR). Also described are: an isolated nucleic acid encoding a HACl protein, where the HACl protein induces

uncoted protein terpures and mas tess times by similarity or years. Protein, an isolated nucleic acid encoding a HACI protein, where the HACI protein induces unfolded protein response and where the HACI protein comprises a DNA binding region that has greater than 70% similarity to the DNA binding region of filamentous fungit HACI protein; a protein chaving unfolded protein response inducing activity and having greater than 70% similarity to a fully defined amino acid sequence of \$51, 349 or 186, or 504 or 1232 amino acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, or 504 or 1232 amino acids (SEQ ID NO: 2, 4 or 16; an isolated conclete acid encoding a PTC2 protein that modulates unfolded protein cresponse and has at least 70% similarity to a fully defined amino acid sequence of 130 or 438 amino acids (SEQ ID NO: 8 or 10) as given in the specification; an isolated nucleic acid encoding a IREI protein that condulates unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 or 14; a protein condulates unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 12 or 14; a protein condulates unfolded protein response modulated protein response modulated protein response modulated protein response modulating activity and a heterologous nucleic acid encoding a protein having unfolded protein response modulating cells to have an elevated unfolded protein cresponse modulating cells to have an elevated unfolded protein cresponse wouthers, the amino acid sequence of trichoderma reesei HACI cresponse and foldase.

Cresponse (URR) resulting in an increased capacity to produce secreted cresponse views. This is the amino acid sequence of trichoderma reesei HACI cresponse and foldase. protein response and has less than 50% similarity to yeast HAC1 an isolated nucleic acid encoding a HAC1 protein, where the HAC1 %\$99999999999999999999998%&

The invention describes a method of increasing the secretion of a heterologous protein in a eukaryotic cell, comprising inducing an elevanded water duribolded protein response (URP). Also described are: an isolated motocic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and has less than 50% similarity to yeast HAC1 protein; a isolated nucleic acid encoding a HAC1 protein, where the HAC1 protein induces unfolded protein response and where the HAC1 protein of filamentous fungith MAC1 protein, where the HAC1 protein induces unfolded protein response inducing activity and having greater than 70% similarity to a fully defined amino acid sequence of 411, 349 or 36, or 50% or 1212 amino acids (SEQ ID NO: 2, 4 or 16, or 12 or 14, response inducing activity and having an amino acids sequence of SEQ ID NO: 2, 4 or 16, or 12 or 14, response and has at least 70% similarity to a fully defined mino acids sequence of 130 or 43% amino acids (SEQ ID NO: 8 or 10) as given in the specification; a protein having unfolded protein response and has at least 60% similarity to a fully defined amino acid sequence with SEQ ID NO: 8 or 10) as given in the modulates unfolded protein response modulating activity and having greater condulates unfolded protein response modulating activity and having greater than 70% similarity to SEQ ID NO: 8 or 10; and a cell containing a protein of sequence with SEQ ID NO: 12 or 14; a protein the protein of sequence with SEQ ID NO: 3 and a cell containing a protein of singlarity to SEQ ID NO: 8 or 10; and a cell containing a protein of sequence with second and condulating and activity and a heterologous nucleic acid encoding a protein having unfolded protein response modulating and condulating cells to he secreted. The methods and compositions of protein of interest to be secreted. The methods and conducing a protein propers modulating cells to have an elevated unfolded protein are useful in e.g. produced the produce secreted proteins, are useful in e.g. produced the 
Increasing the secretion of a heterologous protein, such as a therapeutic or an industrial enzyme, in genetically modified eukaryotic cells by inducing an elevated unfolded protein response (UPR).
                                                                                                                         Example 3; SEQ ID NO 5; 83pp; English

```
The invention relates to a transgenic plant, comprising a recombinant polynucleotide that alters the plant's disease tolerance or resistance when compared with the same trait of another plant lacking the compared with the same trait of another plant lacking the compared with the same trait of another plant lacking the comprisions at least of recombinant polynucleotide. The recombinant polynucleotide of a plant (by: (a) transforming at least of appearing as ABO43093-ABO43148. Also included are altering the disease tolerance or resistance of a plant (by: (a) transforming a plant with the recombinant polynucleotide; (b) selecting the transformed plants; and (c) identifying a transformed plant with the recombinant polynucleotide.

CC resistance), altering the plant with the recombinant polynucleotide, altering the database sequence with the polypeptide or plant by transforming the plant with the recombinant polynucleotide.

(b) comparing the database sequence with the polypeptide or plant plant; at tall (comprising) a database sequence or effective and (d) transforming the selected database sequence with the polypeptide or polynucleotide at low stringency with the recombinant polynucleotide in the plant) and altering a plant's trait (comprising:

(a) providing a test polynucleotide; (b) hybridising the test

CC (a) providing a test polynucleotide; (b) hybridising test polynucleotide in a plant to alter a trait of the plant and test polynucleotide in the plant at the recombinant polynucleotide in the plant plant between the resistance or resistance or resistance to disease. The plants with improved tolerance or resistance or resistance to diseases. The plants have commercial utility for present sequence is an Arabidopsis thaliana transcription factor of the
                                                                                                                                                                                                                                                                                                                                                                  Nechmann JL, Keddie J, Pineda O, Adam L;

The present invention relates to the isolation of plant (Arabidopsis thaliana) transcription factor polypeptide and polymucleotide sequences. Also disclosed are: an expression vector comprising the isolated polymucleotide, a host cell comprising the expression vector, a transgenic plant comprising the isolated polymucleotide, a transgenic plant ectopically expressing the isolated polymucleotide or polypeptide, a method for screening a molecule to identify a molecule that modifies a plant trait by placing the molecule in contact with the plant, and monitoring the effect of the molecule on the expressing or activity of the polypeptide or polymucleotide, and producing a transgenic plant having a modified trait by ectopically expressing the isolated plant and selecting a plant with the modified trait. The polypeptide and selecting a plant with the modified trait, and for polypeptide and electing a plant with the modified trait, and for producing plants with modified traits. The present sequence represents a plant transcription factor polypeptide of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USDFTO web site at sequence.
                                                                                                                 Plant, transcription factor, transgenic plant, transgenic, plant trait, modified trait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polypeptides and polynucleotide sequences, useful for screening a molecule to identify a molecule that modifies plant trait, and for producing plants with modified traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Heard J, Riechmann JL, Adam L, Broun P;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 178.5; DB 7; Length 409; Pred. Hack protein is a transcription factor involved in the unfolded protein response (UPR). Overexpression of an inducing form of hack enables production of higher levels of secreted heterologous proteins in A. niger. The invention provides methods for increasing the secretion of a heterologous protein in a cell by inducing an elevated UPR. This can be achieved by modulating the activity of HAC1 (or hack), PTC2 or IRE1 in the cell, e.g. by gene overexpression. The cell from which the protein is secreted can be any cell having an UPR, such as mammallan cells, insect cells, yeast and filamentous fungi. The protein of interest can be any secreted protein such as a therapeutic protein or an industrial enzyme, e.g. lipase.
